### Concentration of radiocesium (134Cs+137Cs) in fishes in the western North Pacific (except for coastal areas near Fukushima Prefecture)

A yellow dotted line indicates the regulation value for fish (100 Bq/kg). Currently the concentrations are significantly lower than 100 Bq/kg.

### Concentration of radiocesium (134Cs+137Cs) in freshwater fishes

Concentration of radiocesium (134Cs+137Cs) in freshwater fishes. The concentrations have been relatively high compared to those of marine fishes.

### Concentration of radiocesium (134Cs+137Cs) in fishes off the coast of Fukushima Prefecture

The concentration is decreasing. Currently majority of the samples have the concentration of less than 100 Bq/kg.
